

UNDERSTANDING PERIODONTAL (GUM) DISEASE

Periodontal diseases occur when a bacterial infection develops where the gums join the teeth. Harmful bacteria release enzymes that can cause underlying bone loss, receding gums and eventual tooth loss.

PERIODONTAL DISEASES

- #1 cause of tooth loss in adults
- Affect more than half of people over age 30
- Often painless and may go undetected
- May be genetic and inherited

Bacteria associated with periodontal diseases can travel into the bloodstream and may result in other adverse health effects. This makes early detection of periodontal diseases critical.

DO YOU HAVE PERIODONTAL DISEASE ?

Do you have red, swollen, bleeding gums, persistent bad breath or tooth sensitivity? You may have some form of periodontal disease.

In a healthy mouth, shallow (1-3 mm deep) pockets exist where the teeth meet the gums. When gum disease occurs, these pockets deepen. Deeper pockets accumulate harmful bacteria, which may lead to increased gum inflammation and eventual bone loss.

Your Dentist or Dental Hygienist evaluates the health of your gums during an examination that includes probe readings to measure the depth of your pockets.

INTRODUCING PERIOWAVE™

Periowave™ is a quick and painless technology that works to kill the bacteria associated with periodontal diseases, without the promotion of antibiotic resistance.

Periowave™ utilizes a non-thermal laser light combined with a photosensitizing solution designed to kill bacteria associated with the diseases. Killing the bacteria halts the progression of the disease and allows healing to begin.

PERIOWAVE™ is:

- Painless
- Non-Antibiotic
- Quick
- Effective
- Safe
